FACILITY:

Job controller.

ABSTRACT:

This module contains the routines that manage services that complete asynchronously to the original request. Many such instances require communication with remote job controllers in a cluster.

ENVIRONMENT:

VAX/VMS user and kernel mode.

AUTHOR: M. Jack, CREATION DATE: 16-Feb-1982

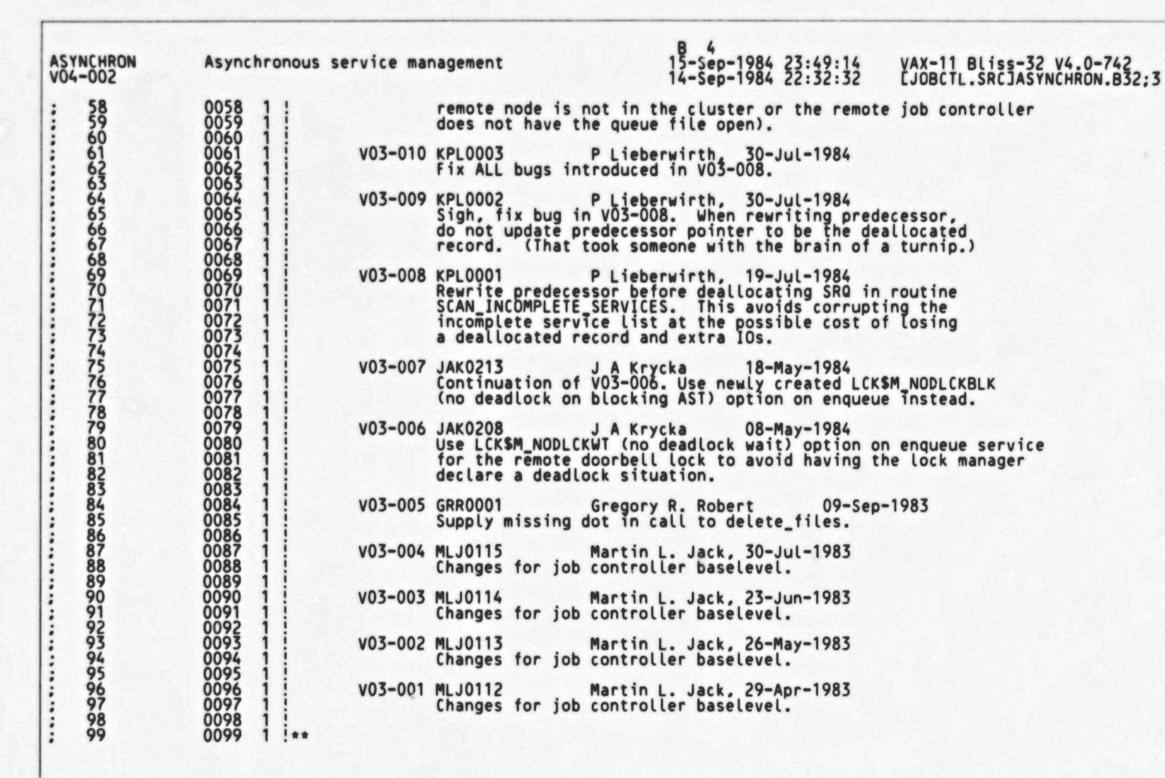

MODIFIED BY:

V04-002 JAK0236 J A Krycka 14-Sep-1984 Collect more diagnostic information.

                           ROUTINE ENTER_REMOTE_REQUEST_AST(LKSB): NOVALUE=
  FUNCTIONAL DESCRIPTION:
This routine is the completion AST routine for obtaining another job controller's remote request lock.
                             INPUT PARAMETERS:
                                    LKSB
                                                      - Pointer to LKSB allocated from dynamic memory.
                             IMPLICIT INPUTS:
                             OUTPUT PARAMETERS:
                                    NONE
                             IMPLICIT OUTPUTS:
                                    NONE
                             ROUTINE VALUE:
                                    NONE
                             SIDE EFFECTS:
                                    NONE
                           BEGIN
                           MAP
                                    LKSB:
                                                      REF BBLOCK:
                                                                         ! Pointer to lock status block
                             Check status of the $ENQ.
                           IF NOT .LKSB[0,0,16,0]
                           THEN
                               SIGNAL (JBC$_COMREMJBC OR STS$K_ERROR, 0, .LKSB[0,0,16,0]);
                             Release the lock to enable the receiving job controller to recover it.
                           $DEQ(LKID=.LKSB[4,0,32,0]);
                             Deallocate the LKSB.
                           DEALLOCATE_MEMORY(.LKSB);
